ForgeGIS Studio™

The Fastest Way to Evaluate What the Forge Suite Does

The Forge suite is engine-first: ForgeGIS™ computes on the GPU, ForgeData™ finds the right data, ForgeMind™ turns plain language into validated pipelines. ForgeGIS Studio™ is where an evaluator watches all three work on one map — building pipelines by hand, running them over a folder, and asking the agent to act on the map in front of them. Seaglass Globe™ is the suite's other map, in 3D; the Seaglass Control Center™ installs, starts and watches them all.

Map

a live map in the browser

catalog data, your own files, your XYZ, WMS or WMTS services by URL, and the agent's answers drawn on it

Canvas

pipelines built by hand

raster, vector and mixed; linear chains run as you build, branching graphs run in batch

Agent

that acts where you ask

ask in Studio's chat and the answer lands on Studio's map, not in another window

One catalog under everything

Studio reads through ForgeData — embedded in-process — rather than owning file I/O, so the datasets you browse in Studio are the ones the agent routes to and the Globe draws. Remote sources become readable through the catalog, and area-windowed reads pull only the pixels you need.

Proven once, run everywhere

A pipeline built on the canvas saves to the library in the same versioned format the batch runner uses. Prove it on one area, then run it across a folder — raster batches on the suite's compute broker when it is installed — with a dry run first and a report at the end.

The agent on your map

ForgeMind acts on the canvas through an authenticated bridge — named markers, overlays, camera moves, reports — with the scene you are looking at sent along with each question. Named results are kept in the catalog and come back after a restart.

New in 1.2.6. Studio's raster batches now run on the suite's compute broker when it is installed — the same broker ForgeMind sends batch work to — and fall back to this machine when it cannot take them. The rest of the release is about being right: elevations in the data's own vertical units, measurements on the WGS84 ellipsoid, and a guard that refuses any request not addressed to the local machine.

AN EVALUATION IN ONE SITTING

Install and open

Run the Forge Suite installer on a Windows x64 workstation, then in the Seaglass Control Center pick ForgeGIS Studio on the Components screen, connect an AI provider — Claude, OpenAI, Gemini, Grok, or a model server you run such as Ollama — and click Start suite, then Open Studio. A sample elevation dataset ships with the suite, so the first slope and hillshade need no download.

Build, run, ask

Put a hillshade on the sample DEM and adjust its parameters; add a slope beside it from the same DEM; save the slope chain to the library and run it in the batch runner over catalog datasets or a folder of your own rasters. Then ask the agent in plain language to mark a site and map the terrain around it, and watch it happen on the map you are looking at.

Bring your own

Drop a KML, KMZ or zipped shapefile onto the map, add your own XYZ, WMS or WMTS service by URL, or register a folder of rasters in the catalog. On a workstation installed for everyone, a shared catalog lets a team see the same curated data.

What to check while you are there

Point at a DEM and the elevation reads in the units the data states, or says the units are unknown — never an assumed metre. Measure a path and the length is on the WGS84 ellipsoid, leg by leg. Run a viewshed and the legend names its classes in words. Drop a raster with no georeferencing and Studio says its position is unknown instead of drawing it in the wrong place.

Where Studio stops, on purpose. Studio is not a general-purpose GIS desktop. It is single-user and single-host, with no login on its browser API, and branching graphs run only in the batch runner. Since 1.2.6 Studio's raster batches go to the suite's compute broker when it is installed; vector and mixed batches, and any the broker cannot take, run on the local machine, one at a time.

Evaluate the Forge suite

The Technical Brief covers Studio in depth. ForgeGIS Studio is part of the Forge suite and is not sold separately. The Forge suite is commercially licensed; evaluation builds are available to qualified teams.
